

FIRST LOOK

# ONE PLATFORM FOR THE WHOLE JOB SITE.

Safety, schedule, people, field operations and supply chain, all working from the same records. Here's a look inside.

**Swipe to look inside →**

WHAT IT IS

# NOTHING TYPED TWICE.

Every module shares the same projects, people and records. Report an incident once and safety, the schedule and leadership all see it.

**Mission Control**

The daily cockpit

**Executive Command**

Strategy, ops, finance

**Project Delivery**

Plan, work orders, lessons

**People**

Team, schedule, hiring

**Field Operations**

Site, drones, fleet, ERMD

**Safety Command**

Incidents to audits

**Intelligence Engine**

Risk and AI oversight

**Project Media**

Drawings, BIM, documents

**Supply Chain**

Stock, logistics, automation

**Trades Network**

People, contracts, apprenticeships

**Digital Foreman**

AI assistant for the field

**Regulatory Compliance**

Permits and reviews

**Emergency Command**

Declare, muster, drill

**Cortex**

Ask the project a question

**Mobile companion**

Coming soon

# THE PROJECT KNOWS WHAT IT DOESN'T KNOW.

## 1 Nodes you can read at a glance

Every node is something real on the job: a phase, a permit, a risk. Lines show what depends on what.

## 2 Fill the gaps

Gaps become plain questions. Answer them and the graph fills in.

# SAFETY, ESCALATED BEFORE IT'S A HEADLINE.

- 1 Safety on record**  
Certifications, WHMIS, PPE assignments and open risks, with an escalated warning when something's past due.
- 2 Escalation queue**  
Property damage, near misses and environmental exceedances flagged critical, with where they happened.

# RISK SCORES THAT MOVE WHEN CONTROLS GO IN.

The screenshot displays the 'Risk register' section of the Safety Command interface. It shows a list of risks with their current scores and review dates. Two callouts highlight specific features:

- Callout 1:** Points to the score calculation for 'MSI – Manual Materials Handling'. The score is  $4 \times 4 = 16$  (critical). The next review date is 9/7/2026.
- Callout 2:** Points to the 'Worker Overboard / Drowning' risk. The score has changed from  $4 \times 4 = 16$  (critical) to  $3 \times 4 = 12$  (high) because controls were implemented. The next review date is 4/10/2028.

The interface also includes a sidebar with navigation options (Overview, Incidents, Hazards, Zones, Risks, Follow-up, Meetings, Drills & emergencies, Certifications) and a top bar with a search bar and a timer.

## 1 The score

Likelihood  $\times$  severity.  $4 \times 4 = 16$  is critical. Next review date sits underneath.

## 2 Scores that move

Worker overboard was 16 (critical) and is now 12 (high) because controls went in. The register keeps both.

# DONE ISN'T CLOSED UNTIL SOMEONE CHECKS IT WORKED.

- 1

### Corrective actions

93 actions, none overdue. Each has an owner, a due date and the control type (training, PPE, engineering).
- 2

### Verify it worked

Done isn't closed. Someone has to confirm the fix worked in the field.

# DRAG A FACE ONTO A TASK. THAT'S SCHEDULING.

- 1 The Gantt**  
Pile driving and pile caps at Pier 1, with critical-path, float, over-budget and baseline markers.
- 2 Drag a face onto a task**  
Each circle is a crew member. Drop one on a task to put them on it.
- 3 AI suggestions**  
Two tasks lack crews. The assistant offers to assign them.

REAL SCREEN • DEMO PROJECT

Name, role and permission level. “No account yet” means they're on the roster but haven't signed in.

Set anyone's supervisor with Change. With nobody on record, incidents go to the project admins.

# ONE BUTTON ALERTS THE WHOLE PROJECT.

## 1 Declare an emergency

Alerts everyone on the project at once. It says plainly that it doesn't replace calling 911.

## 2 Who would be on the roll

200 people are on the project, and each checks in from their own phone once an emergency is declared.

# AN ASSISTANT THAT ANSWERS FROM CODES, NOT THE INTERNET.

- 1 Things to ask**  
Code lookups (IBC egress for a 3-storey building), retrospectives (past electrical overruns), trade logic (which trades a healthcare job needs).
- 2 Ask in plain words**  
Type a question and press Enter. Answers cite the records they came from.

# COST CONVERSATIONS THAT START FROM OFFICIAL NUMBERS.

## 1 Official signal feed

A ticker of headline releases for British Columbia, each tagged positive, neutral or negative for the project.

## 2 The indicators

Shelter price index, consumer price index, employment and participation rate, each with its change since the last release and the source table.

COMING SOON

# THE MOBILE COMPANION.

Not a shrunk desktop. It knows who you are, where you are on site and what's happening, and shows each role only what it needs.

Crew member

Foreman

Emergency declared

COMING SOON

# A WORKING PART OF THE PLATFORM.

Every phone on site sends in check-ins, photos, voice notes and sign-offs as they happen, so the office sees the job as it is.

## Place

Walk into a site zone and its hazards, permits and your task come to the top.

## Person

Your tickets, language and equipment authorisations shape what you see.

## Moment

When an emergency is declared, every phone switches to the muster check-in.

## No signal

Captures stay on the phone and sync when you're back in range.

Safety lead

Executive

WHAT'S NEXT

# STILL BEING BUILT.

## MOBILE COMPANION

COMING SOON

Role-specific apps for crews, foremen, safety, executives, inspectors and subcontractors.

## SITE SIGN-IN & LOCATION

COMING SOON

Who's actually on site, feeding the live emergency roll.

## SUBCONTRACTOR DASHBOARD

COMING SOON

A sub's own work, safety records and documents in one place.

## LIVE SITE MAP

COMING SOON

Units, fleet, plant and risk on one map of the site.
